Analysis of
Agricultural Feeds
and Pet Foods
Sold in Connecticut
1999

BY MARY JANE INCORVIA MATTINA

*Bulletin 962
April 2000*

From January 1, 1999 through December 31, 1999 the Department of Analytical Chemistry at The Connecticut Agricultural Experiment Station analyzed 290 animal feed products sold in Connecticut. The samples represented both products for domestic animals and for commercial agricultural operations. Fifty-three manufacturers were represented. The products were collected by Alton van Dyke and John Schneider of the Connecticut Department of Agriculture and analyzed by Craig Musante and Mamie Pyles under the supervision of Dr. David Stilwell.

Of the total number of samples 41 (14.1%) were found to be unsatisfactory in macronutrients and/or micronutrients. A sample is reported to be unsatisfactory if the found value of a parameter differs from the label guarantee using the percent analytical variation guidelines recommended by the Association of the American Feed Control Officials. The results of our analyses are shown in Tables 1 and 2. All values are in percent unless otherwise indicated; a deficiency in a guaranteed value (G) is indicated by a minus (-) sign next to the found parameter (F) and an excess of a substance by a plus (+) sign. Specifically, nine samples were deficient in protein; nine deficient in fat; eleven deficient in fiber; and thirteen deficient in one or more micronutrients.

Table 1. Feed Samples Analyzed During 1999.
